Assignment: Mobile Application Project

Planning Using Taiga (CIE – 1)

BCA(Hons.) | SOCSE

Course: CS2030 - Agile Software Engineering

Name: Indranil Saha

USN :1RUA24BCA0034

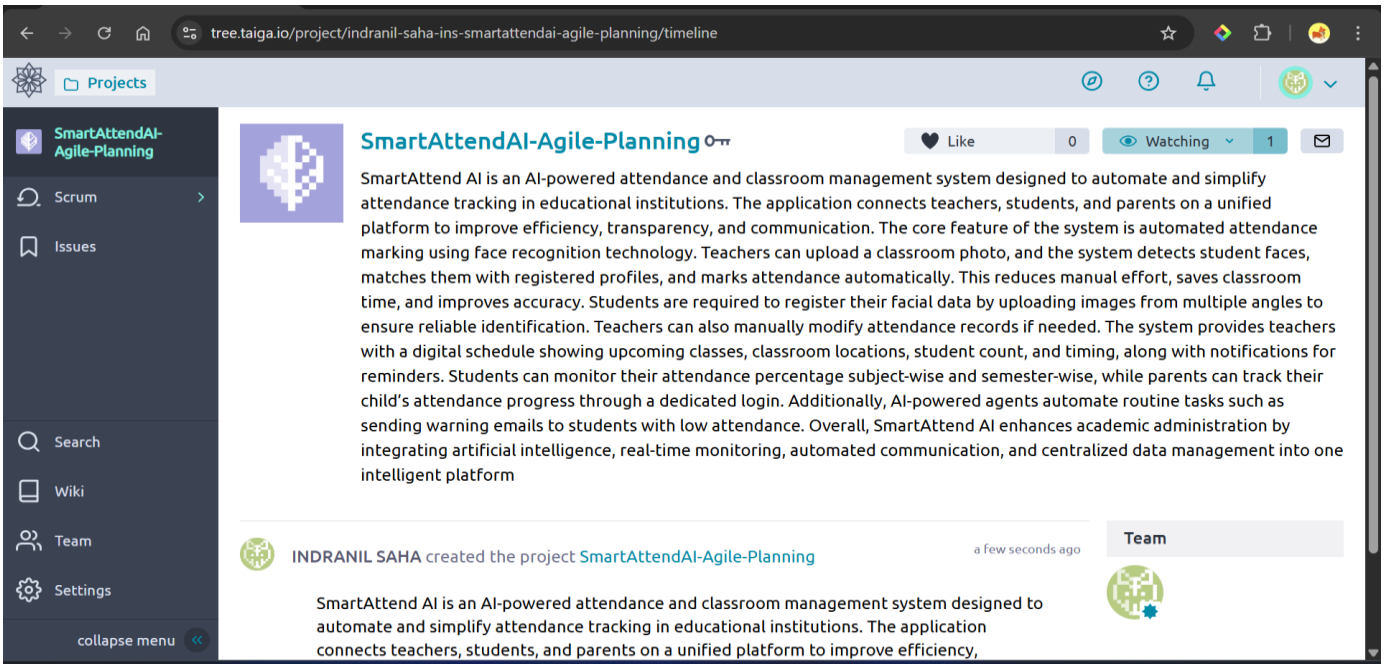
App Name: **Face Track Edu — An AI-Driven Platform for Automated Attendance, Academic Monitoring, and Smart Campus Management**

Platform: Android

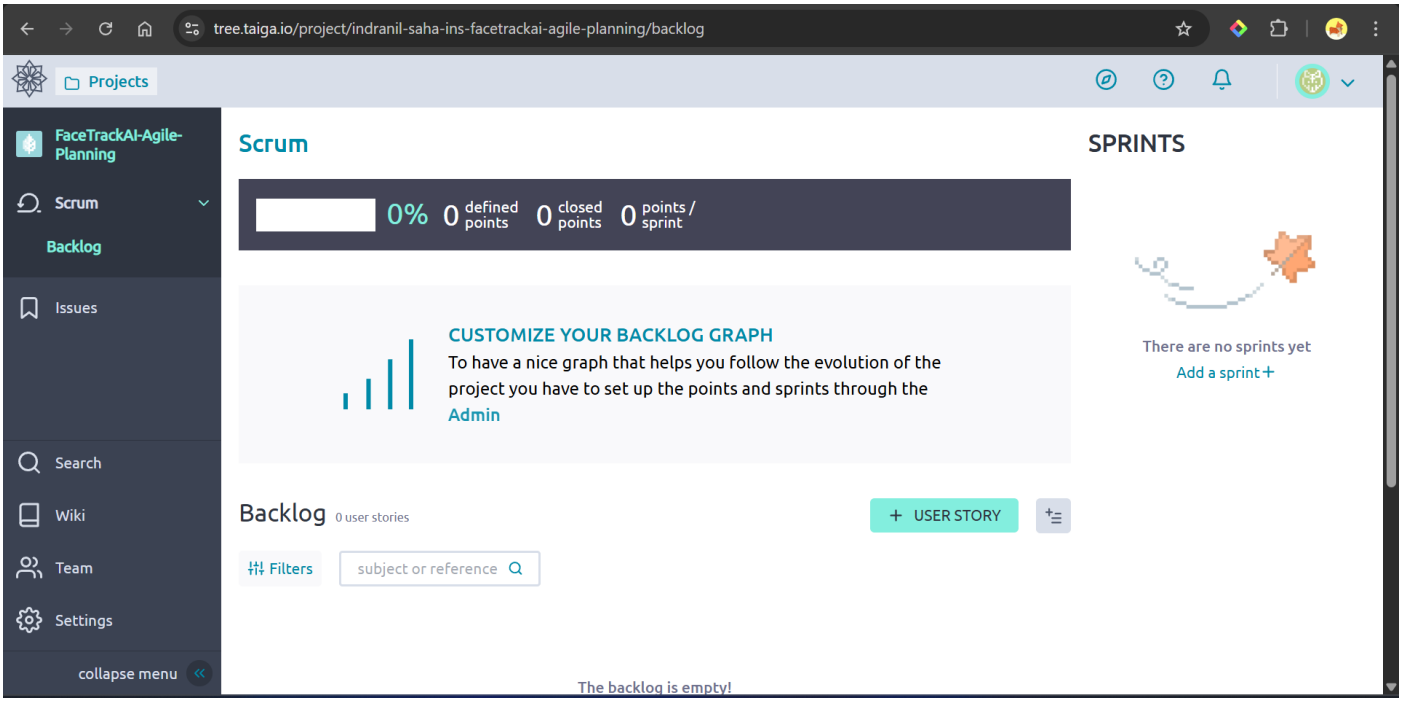
Problem Statement:

Manual attendance tracking in colleges is time-consuming, error-prone, and inefficient. Teachers often rely on roll calls or paper registers, which wastes valuable class time and makes record management difficult. Students and parents also lack real-time visibility of attendance and academic schedules. Additionally, monitoring low attendance and notifying students requires repetitive manual work. This system solves these problems by automating attendance using AI face recognition, providing real-time tracking, and enabling seamless communication between teachers, students, and parents.

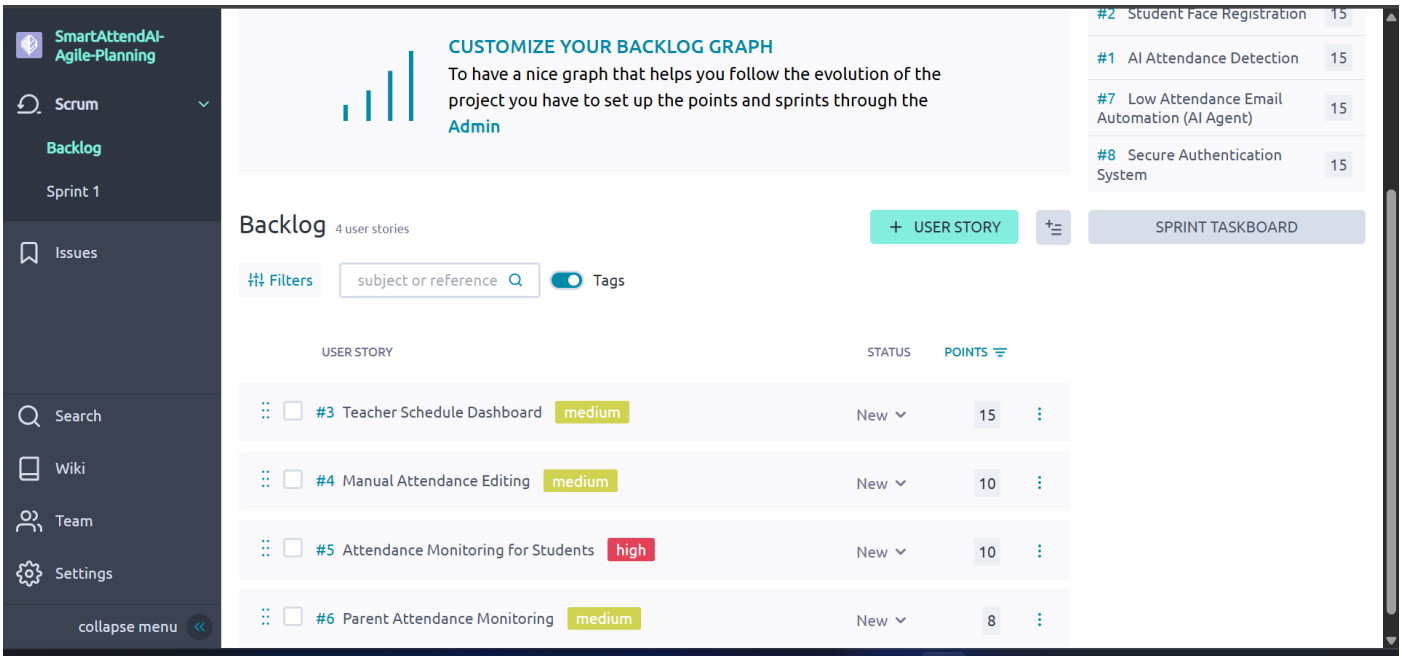
Target Users: Teachers, Students, Parents, Colleges



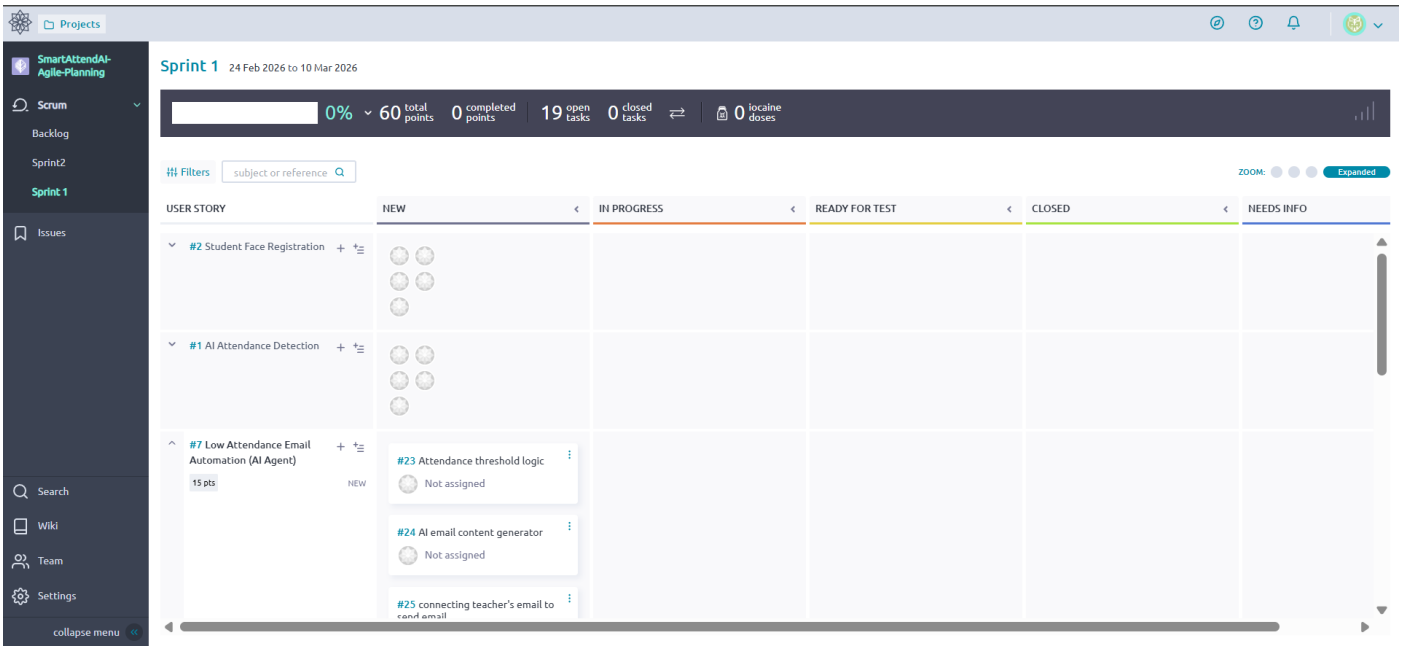
Creating New Project in Taiga: Taiga Project Screenshot



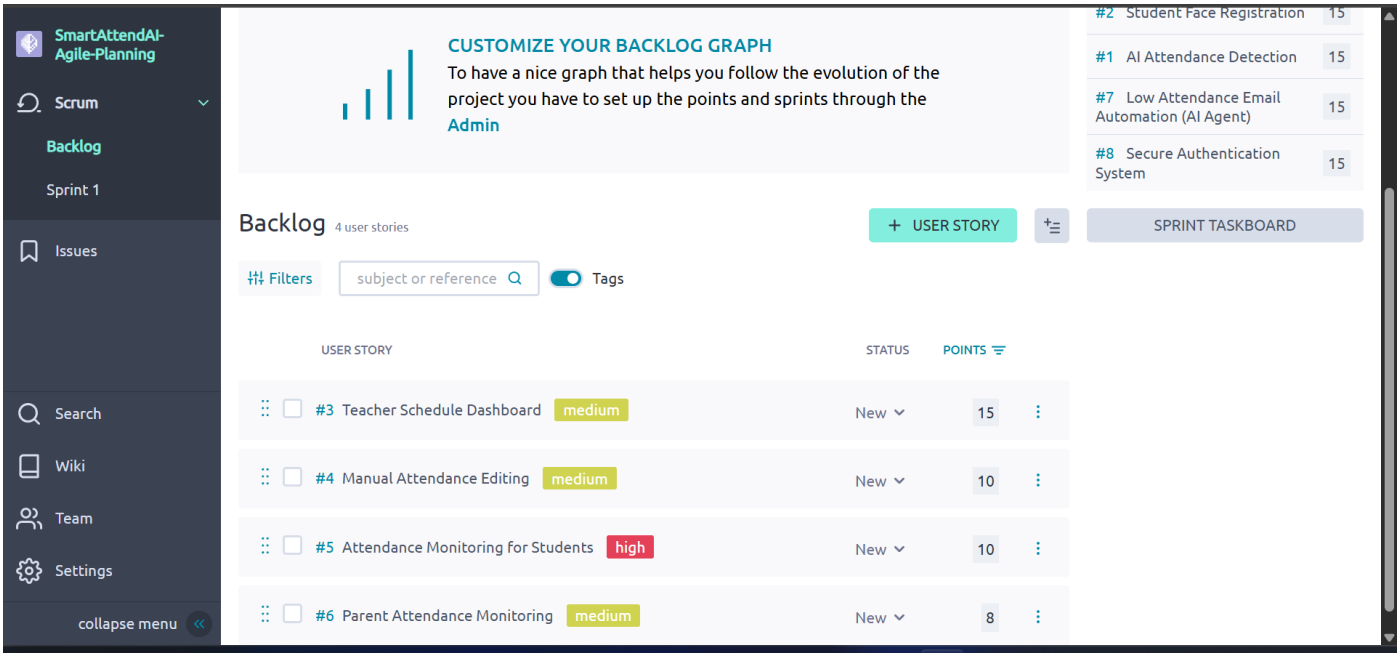
Creating Product Backlog (6 User Stories): Backlog Screenshot



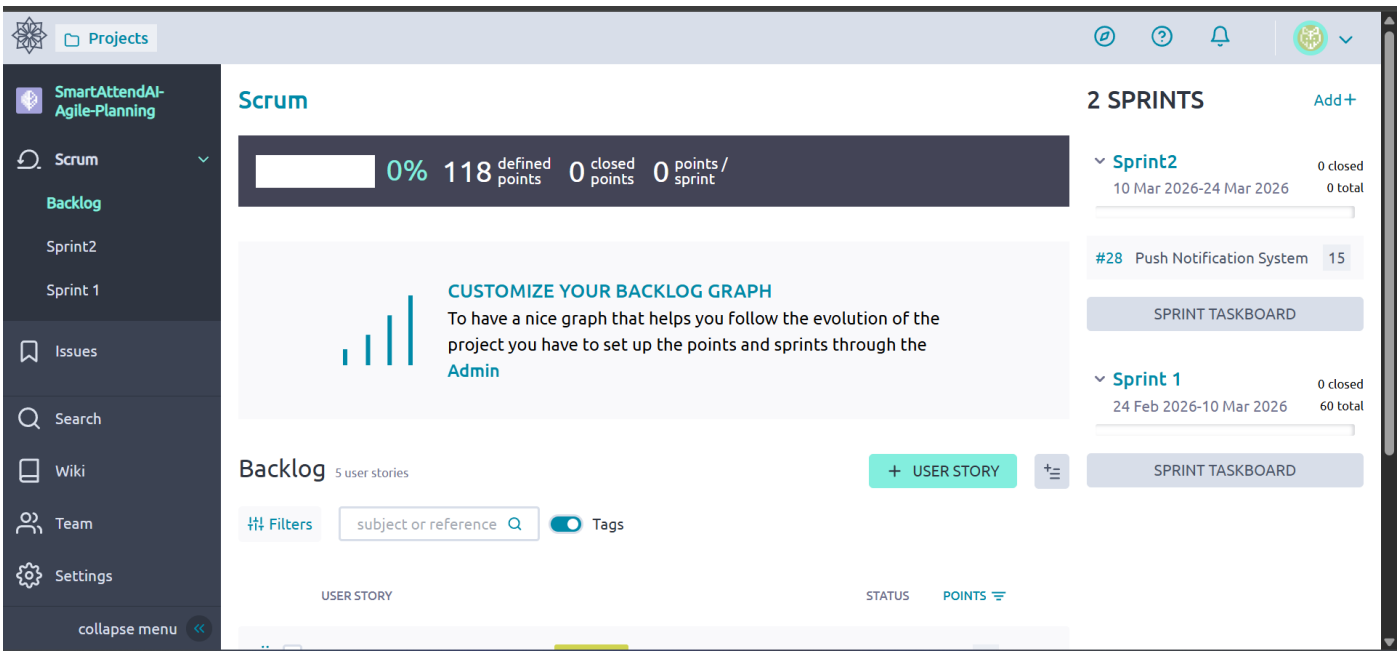
Sprint Planning: Sprint Board Screenshot

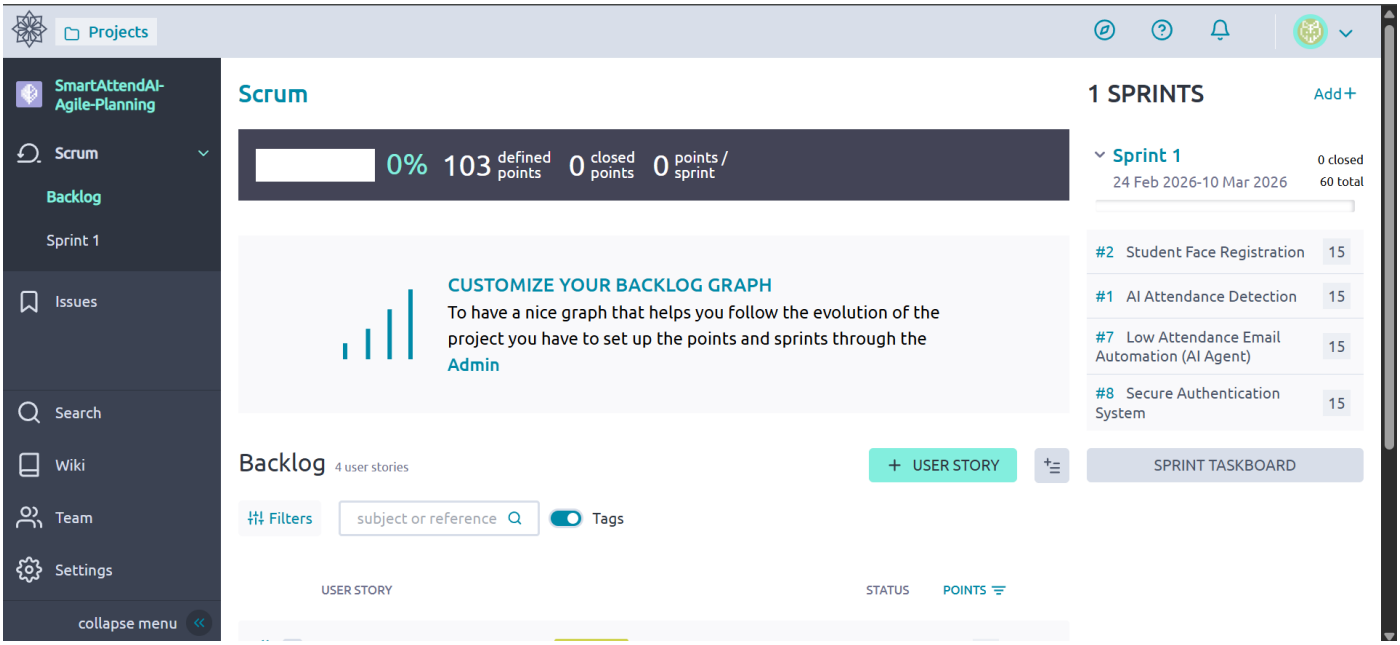


Change Simulation: Updated Backlog (after change)



New User Story Added In The Sprint2





1. **Why is Agile suitable for your mobile app?**
   Agile is suitable for my mobile app because the project includes complex and evolving features like AI face recognition, automated attendance, and multiple user roles (teachers, students, and parents). While developing, I may discover better ways to improve accuracy, user experience, or automation workflows. Agile allows me to build the system step by step, test features early, and continuously improve them based on feedback. Instead of planning everything perfectly from the beginning, I can adapt and refine the app as development progresses, which is very practical for AI-based systems.

2. **How did Taiga help in planning?**
   Taiga helped me organize the entire project in a structured and visual way. Creating user stories helped me think from the perspective of different users and clearly define what each feature should do. Assigning priorities and story points helped estimate effort and decide what to build first. The sprint board made it easy to track progress and manage tasks step by step, just like real-world software development teams do.

3. **What happens when requirements change?**
   When requirements change, Agile makes it easy to adapt without disrupting the whole project. I can create a new user story, update its priority, and add it to the backlog. Then it can be planned for the next sprint. This flexibility allows the project to grow and improve continuously without affecting already completed work.

4. **What was challenging while using Taiga?**
   The most challenging part of using Taiga was understanding how to properly structure user stories and where to include details like acceptance criteria. It also took some time to understand how backlog prioritization, story points, and sprint planning actually work in practice. Once I understood the workflow, it became much easier to manage the project.

Thank you
